

Cloning strategy:

- I: microRNA forward
 II: microRNA reverse
 III: microRNA* forward
 IV: microRNA* reverse

	forward oligo	reverse oligo	template
(a)	A	IV	pRS300
(b)	III	II	pRS300
(c)	I	B	pRS300
(d)	A	B	(a)+(b)+(c)

The amiRNA containing precursor is generated by overlapping PCR. A first round amplifies fragments (a) to (c), which are listed in the table above. These are subsequently fused in PCR (d).

Oligonucleotides A and B are based on the template plasmid sequence. They are located outside of the multiple cloning site of pBSK to generate bigger PCR products.

Their sequences:

A 5' CTG CAA GGC GAT TAA GTT GGG TAA C 3'
 B 5' GCG GAT AAC AAT TTC ACA CAG GAA ACA G 3'

Cloning protocol:

PCR reactions (a), (b), (c):

5 μ l 10xPCR buffer (with Mg ⁺⁺)	95°C 2'
5 μ l dNTPs @ 2mM	95°C 30"
2 μ l each oligo @ 10 μ M	55°C 30" -> lower temp. for (b)
2 μ l plasmid DNA (1:100)	72°C 40"
0.5 μ l Pfu	-> 24 cycles
33.5 μ l water	72°C 7'

-> 50 μ l	

run on 2% gel -> cut bands -> elute in 20 μ l water

PCR reaction (d):

5 μ l 10xPCR buffer (with Mg ⁺⁺)	95°C 2'
5 μ l dNTPs @ 2mM	95°C 30"
2 μ l oligo A @ 10 μ M	55°C 30"
2 μ l oligo B @ 10 μ M	72°C 1'30"
0.5 μ l PCR (a)	-> 24 cycles
0.5 μ l PCR (b)	72°C 7'
0.5 μ l PCR (c)	
0.5 μ l Pfu	
34.5 μ l water	

-> 50 μ l	

run on 1% gel -> cut bands -> elute in 20 μ l water

Cloning of PCR products:

Any vector possible, but make sure that you choose the right sites to sequence. T3 and T7 are already part of the PCR fragment.

A-tailing of PCR products and cloning in to pGEM-T-easy works reliably, sequencing can be carried out with oligonucleotides A and B.

To release the amiRNA precursor fragment, any sites of the pBSK multiple cloning site can be used, since they are part of the PCR fragment. We normally use the EcoRI and BamHI sites. EcoRI is at the 5', BamHI at the 3' end of the precursor.

Alternative PCR strategy:

	forward oligo	reverse oligo	template
(a)	A	II	pRS300
(b)	I	B	pRS300
(c)	A	B	(a)+(b)
(d)	A	IV	(c)
(e)	III	B	(c)
(f)	A	B	(d)+(e)
